

ADA University

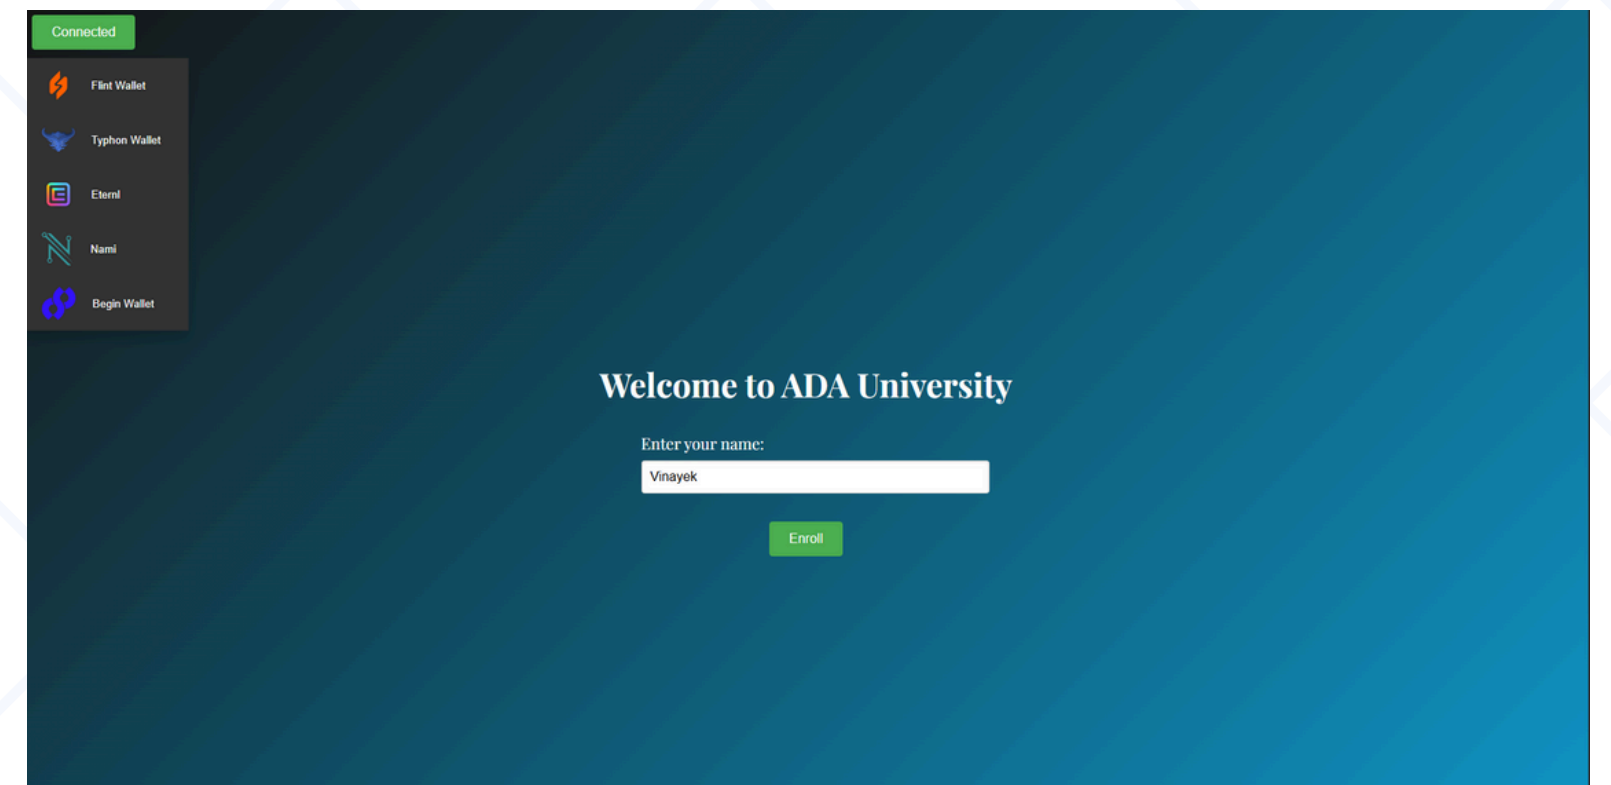

Blockchain Enrollment Process for
ID Card and Bonafide Certificate

Current Issues

- Traditional student ID issuance and certification processes are cumbersome, involving paperwork, manual verification, and potential fraud.
- Centralized storage of student data is vulnerable to hacking and loss.
- Inefficient record-keeping for student information and certifications.

How it can be solved

The project is a dApp that allows students to enroll in a demo university by connecting their wallet. After paying the enrollment fee, they can mint a digital ID card and a bonafide certificate, which are securely stored on the blockchain. This system simplifies the administrative process for both institutions and students, reducing paperwork and enabling the immutable verification of student credentials.
